

WATCH

ABSTRACT

Watch in which the movement (12) pivots in the case (10) and comprises means (26) for correcting the display means (16, 17).

In this watch, the assembly member (22) is so constructed that, in at least one predefined position, the movement (12) occupies a defined position in the case. Moreover, the control system (20) comprises :

- a button (21) accessible from outside the case (10),
- a stem (34) attached to the button (21) and passing through the case (10), and
- a connecting member (28) designed to connect the button (21) to the correcting means (26) and constructed in such a way that, in the defined position, it can be connected to said stem (34)
